"how much is it?" rings mid-job.

you're on a job. the phone rings. you let it go and call back later.

by then, the person asking has often called someone else.

and most of them don't leave a voicemail, so you never see how many there were.

your number, in two minutes.

1 missed calls last week. check your call log, not your voicemail.

_____

2 how many were real customers, not spam?

_____

3 out of 10 people who call you, how many usually book?

_____

4 your profit on an average job.

_____

real customer calls × how many in 10 book × profit per job = what last week's missed calls were worth.

times four = your month.

example: 6 callers × 3 in 10 × $400 = $720 a week.

now set it next to what fixing it costs.

a receptionist: about $3,170 a month in wages (us median).

an answering service: about $10 a call.

an ai agent on your line: priced to your call volume.

if your number is bigger, hear what a voice agent does with the price call.
