the 2am build: a comment becomes a tagged lead while nobody is awake.

this is the complete breakdown of the system from the post: one keyword in a comment triggers a dm in seconds, the person is answered, tagged, and lands in the crm. no human touches any step. what follows is exactly what i built, why i built it that way, how i tried to break it, and how i proved it live — plus the checklist so you can pressure-test any bot you already run.

step 1 — what it does

01 someone comments one agreed word on a post. seconds later they have a dm. when they answer, they are tagged and filed in the crm. it runs at 2am the same as it runs at 2pm.

the real trigger, from the live system: one exact keyword starts the flow. nothing else does.

step 2 — why i rebuilt the engine instead of buying one

off-the-shelf tools do the mechanic well. what they do not promise: that two businesses run through one system can NEVER see each other. if you run this for clients, that promise is the whole job. so i took a proven open engine and rebuilt the walls myself.

step 3 — the five brakes (the part you are actually paying for)

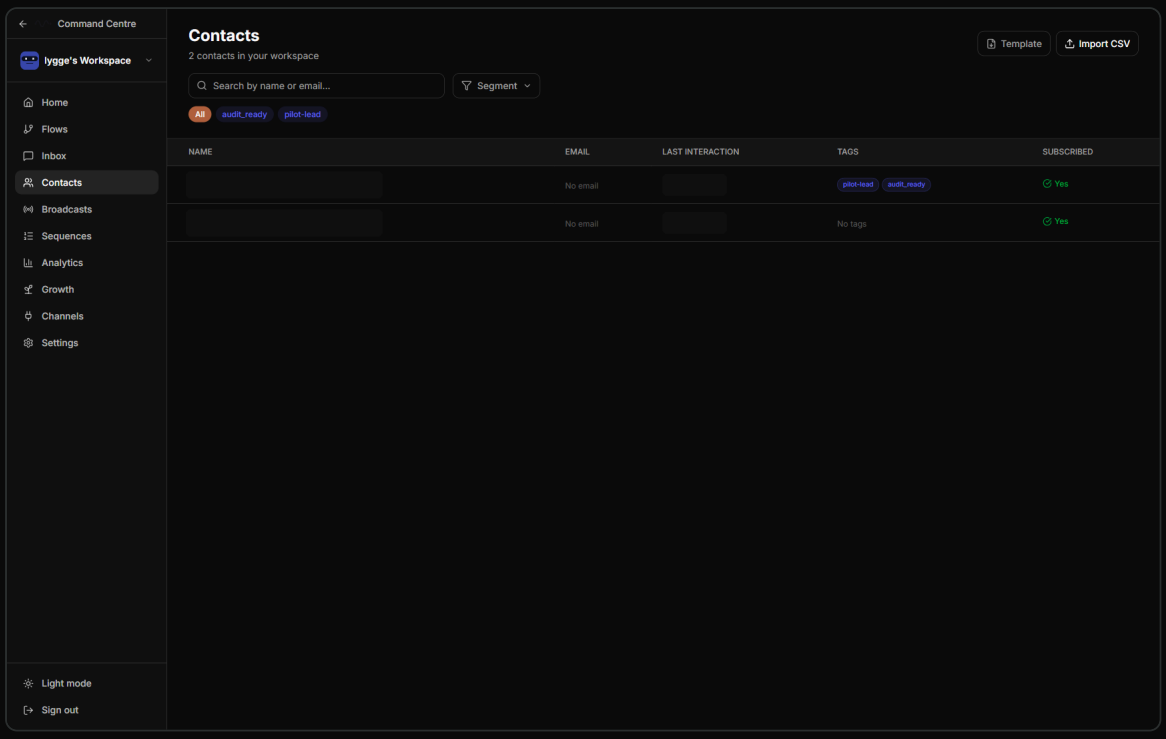

1. **the undo test.** the one action you can never take back - sending to everyone at once - sits behind its own permission. a key without that permission gets refused. i watched the live system refuse one.
2. **break it on purpose.** before it touched a real person i proved 7 separate holes were real by walking through them, then closed each one. a patch for a hole you never proved is a guess.
3. **the look-only key.** after launch i handed the live system a key that is only allowed to read. it let the key read and refused every write.
4. **the peek test.** i ran a second business through it and tried to see the first one's data. the wall held.
5. **fail closed.** one review caught a path where a reply could have gone to the wrong person. it never ran. when the system is not sure, it does nothing - never a best guess on a real person.

step 4 — how it was reviewed before a line of code

four reviewers read the plan first. one of them had a single job: find ways to abuse it. they found four serious problems nobody had scoped — all four went into the plan before the build started. after the fixes, two separate review teams (18 reviewers in all) tried to get in. nothing got through.

step 5 — the live proof

a real comment became a real dm, delivered and confirmed, and the person landed tagged in the crm. end to end, from one dashboard, with receipts.

the payoff, from the live crm: the lead, tagged, subscribed. names hidden on purpose.

the checklist — run it on any bot you already own

01 which action can never be undone? put it behind its own permission - then watch a key without it get refused.

02 who tried to break it on purpose? a hole you proved is a hole you closed.

03 what does a look-only key get? watch the live system refuse the writes.

04 can account b see account a? try to peek. the wall has to hold.

05 what happens when a step fails? nothing, on purpose. never a best guess.

---

want the brakes built into your own process? hit reply with the one process in your business you wish ran itself - i'll tell you exactly how i'd make it safe enough to run while you sleep.

arnaud leclezio — built end to end, measured not claimed.
